DETAILED ACTION

Claims 1-3 are pending.

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 1-3 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

3. Regarding claim 1, the phrase "-type" renders the claim(s) indefinite because the claim(s) include(s) elements not actually disclosed (those encompassed by "-type"), thereby rendering the scope of the claim(s) unascertainable. See MPEP § 2173.05. Claims 2-3 are rejected as being dependent on claim 1.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

> A person shall be entitled to a patent unless –
>
> (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 1-3 are rejected under 35 U.S.C. 102(b) as being anticipated by US# 5,795,682 to Garza.

Garza teaches an attenuating phase shift mask with a guard ring. Disclosed is an attenuated phase shift reticle design having a compensating transmissive region located where side lobe ringing is anticipated to be most severe. Unlike other transmissive regions on the reticle, no integrated circuit features are defined at the location of the compensating transmissive region. Because the radiation giving rise to side lobe ringing is approximately 180.degree. out of phase with the radiation passing through transmissive regions, radiation passing through the compensating transmissive region will reduce side lobe intensity by destructively interfering with the out of phase radiation (Abstract; Figure 3). The attenuating material transmits light at about 2-15 percent and shifts the phase of light by 180 degrees (col. 5, lines 45-55).
